## PROFESSIONAL SUMMARY

Backend Developer with 3+ years of experience building and shipping software products used by real businesses, primarily with PHP and Laravel. Founded and launched my own SaaS product currently serving paying restaurant clients, and contributed to large platforms across booking, education, and telecom sectors. Experienced in SaaS and multi-tenant systems, API development, database optimization, and modernizing legacy systems. A reliable collaborator in agile teams, comfortable across both new builds and existing codebases.

## PROFESSIONAL EXPERIENCE

10/2023 – Present  
Kuwait - Palestine

### Backend Developer

*Approved Tech* 🏷

- Build and maintain backend systems for SaaS, ERP, and booking platforms serving multiple enterprise clients.
- Improve the performance and reliability of high-traffic systems, reducing response times and operating costs.
- Design and implement role-based access systems that keep client data secure across different user types.
- Work in agile sprints, review teammates' code, and write automated tests to catch issues before they reach users.
- Maintain automated testing and deployment pipelines that keep releases fast and stable.

06/2023 – 10/2023  
Kuwait - Palestine

### Backend Developer – Internship

*Approved Tech*

- Completed an intensive 4-month program covering the full software development lifecycle.
- Delivered real features alongside senior developers in a professional team environment.

## EDUCATION

09/2020 – 03/2025  
Palestine

### B.Sc. Information Technology — Web Development

*Islamic University of Gaza* 🏷

Focused on advanced web technologies, database management systems, and software engineering principles. Strong foundation in backend development, OOP, and data structures.

## TECHNICAL SKILLS

---

### Backend

PHP 8+, Laravel 10+, API Design, RESTful APIs, OOP, SOLID Principles, MVC, API Documentation

### Architecture

SaaS, Multi-Tenant Systems, RBAC, Redis Caching, Queue Systems, REST APIs, AWS S3 Compatible Storage

### Practices

TDD, Automated Testing (PHPUnit), Code Review, CI/CD (GitHub Actions), Agile/Scrum, Git

### Databases

MySQL, PostgreSQL, Database Design & Migrations, Query Optimization, Performance Optimization

### Frontend

JavaScript, Tailwind CSS, HTML, CSS

### Strengths

Product Ownership, Problem Solving, Legacy System Modernization, Team Collaboration

## KEY PROJECTS

---

04/2026 – Present

### Sufra

*Restaurant Management & POS SaaS*

- Founded and built a complete restaurant management platform from my own idea — handling product, development, and launch end-to-end.
- Currently live and in daily use by real restaurant clients, covering point-of-sale, kitchen display, table management, digital QR menus, online ordering, inventory, and sales reports.
- Built an offline-first system so the platform keeps working when the internet goes down — orders are never lost and sync automatically once the connection returns, a critical need in unstable-connectivity environments.
- Designed a secure role-based access (RBAC) system separating restaurant owners, staff, and platform administrators, with multi-tenant data isolation.

10/2023 – Present

### BookForMe

*Booking & E-Commerce SaaS*

- Joined an established engineering team on a large, live booking platform (multi-repository codebase) and quickly became productive with no formal handover.
- Contributed features and improvements across the platform — bookings, calendars, rescheduling, e-commerce, inventory, staff, and branch management — without disrupting existing clients.
- Integrated multi-currency payment gateway processing across 3+ currencies, helping the platform serve businesses in multiple markets.
- Maintained full Arabic and English support so the product works seamlessly for users in both languages.
- Collaborated closely through code reviews to keep quality high across a fast-moving team.

09/2025 – 04/2026

### UOP Dashboard

*University CMS*

- Took over a 10-year-old system that had become slow and expensive to run, and modernized how it stored and served files.
- Redesigned file storage using a polymorphic data model so each image or document is stored once and reused everywhere — cutting waste and duplication.
- Safely migrated a decade of existing data into the new system with zero data loss.
- Automated image optimization (WebP conversion) via background queue jobs so pages load faster and the system costs less to operate.
- Delivered a major improvement in speed and running costs across the whole platform

01/2026 – 02/2026

### **NetSpeed**

#### *Internet Service Provider Platform*

- Brought in to fix a platform that the owner reported as consistently slow under heavy user load.
- Diagnosed the database bottlenecks and introduced Redis caching, reducing database load by ~60% and bringing response times under 200ms at peak.
- Redesigning the customer-facing interface to make the most common tasks simpler and quicker.
- Platform covers internet card management, loyalty and rewards, support tickets, and field operations.

02/2025 – 03/2025

### **Taskat**

#### *Team Collaboration Platform*

- Built the backend for a platform that combines task boards, sprint planning, and team messaging — similar to Jira and Slack in one tool.
- Designed a multi-tenant architecture to serve many teams efficiently under a single shared system, keeping costs low.
- Created a flexible, dynamic permissions system so each team can define custom roles across multiple projects.

## **Languages**

---

• Arabic

• English
